

Orientation document: Pass The Ball

By: Simeon Markov

Class: EN08

Course: ICT

Introduction

In this document I explain how I orient myself in specific topics, exploration on different themes and reflection on the workshops I attended.

ICT Topics

For this project I chose Software development, Media design and AI and during incorporating elements of each topic I learned something new. With software development I learned new principles, patterns and how to implement them into my project. The media design pushed me into rethinking how users interact with applications, layout principles, accessibility and etc. And last, but not least I learned how to implement generative AI into my project, and explore different AI providers and their models and limitations.

Workshops

I attended several workshops during this project, including Docker workshop: How to isolate applications, resolve compatibility issues. Then followed the GIT workshop, which was about how to set up git, working in groups, resolving conflicts, how do they occur, tracking history and working in different branches. There was a business workshop as well, where we learned more about the course structure, what will we be doing if we choose this topic for the next semester. This workshop was helpful in helping me realise the importance of having clear goals, requirements, project plan and setting a clear boundary especially all that is helpful when working in team.
