Reflection document: Pass The Ball

By: Simeon Markov

Class: EN08

Course: ICT

Introduction

In this document I reflect on the feedbacks I received for this project, thinking on what I could have done better.

Checkpoint 12/13: Planning + progress + design

From this feedback I learned that I have to come with a clear introduction for each document I am presenting, thus letting the reader be familiar with the content I am about to present. Another think is that It is better have a separation between chunks of information if it is appropriate. Moreover, I got more familiar with the analysis document structure (what should be included), in my case I overlapped in the project plan and analysis document, having mentioned the prioritization technique of requirements into the project plan, then I moved it to analysis document.

Checkpoint 14/15: Project state

From this feedback I learned that before doing any live demo I should come up with a test plan, ensuring if (at least) major functionalities are working correctly. This is done from user's perspective, while application tests like unit testing are isolated. I also restructured the design document moving the decisions to the design document (design decisions), having clear record of initial design and implications vs actual realization.

Checkpoint 16: More concise documentation

During this feedback session, was considered how could part of the documentation be shorter (without additional info). The proposed solution was to cut short details and focus on more abstract explanation, linking external sources (e.g. GitHub repos) for extensive reading.

Checkpoint 17: Final presentation

During this session I got recommended to keep track of my presenting time, paying more attention to actually presenting the application rather than falling into unnecessary details.
